Project Title: Airline Business Intelligence using SQL and Power BI

Module Photographs:

Project Description:

Airline Business Intelligence using SQL and Power BI is a data analytics project designed to analyze airline operations, passenger trends, flight performance, revenue, and customer behavior using SQL and Microsoft Power BI. The project involves collecting and transforming airline-related data such as flight schedules, routes, passenger details, ticket bookings, delays, cancellations, and revenue. SQL is used to store, clean, filter, join, and analyze the data, while Power BI is used to create an interactive business intelligence dashboard. The dashboard provides key performance indicators (KPIs) and visual insights into passenger demand, flight occupancy, revenue generation, delays, cancellations, and route performance. Interactive Power BI reports allow users to filter information by airline, route, date, airport, and flight status, enabling faster and more informed business decisions. Overall, the project demonstrates how SQL-based data analysis combined with Power BI visualization can transform raw airline data into meaningful business insights and support strategic decision-making in the aviation industry.
